

Current Assumption:
Keep the association
between Dataset and
Instance/Label as
aggregation. Though
easily changeable to bi-
directional

Current Assumption: Instance methods
are navigable from LabelAssignment,
but not the other way around. If we
keep this bi-directional, we will be
populating an ArrayList in Instance
which will be never used in future. This
design is easily changeable in next
iterations. The same assumption is true
for other one-way associations.
